

Self-Initiated Task

JINGCHENG (JENSEN) CHEN

Background

After reviewing the job description for the Graphic Designer role at Linkedin and attending the Graduate Jobs and Internships Autumn Fair, where Nicole introduced the company and its marketing direction, I began thinking about how a graphic designer with video editing capability could contribute to Sungrow's marketing and product communications.

One potential direction that came to mind was short-form social media content. Platforms such as TikTok often rely on trending visual effects and fast-paced storytelling to attract attention. I wanted to explore how these trends could be adapted to communicate Sungrow's product value in a way that feels engaging and relevant to a broader audience.

I have an idea

While exploring current trends, I noticed a popular transition effect from the film Pegasus 3. The dynamic motion and high-energy pacing of racing scenes immediately caught my attention.

I started thinking about how this visual language could connect with Sungrow's business. Racing and energy share a natural connection through themes of speed, power, and technology. While reading Sungrow's website, I came across the EV Charging Solution, which made the connection even clearer: electric vehicles represent the future of mobility and energy innovation.

Based on this idea, I decided to create a clip that uses a racing-style transition to introduce Sungrow's EV charging solution in a visually engaging way.

Production Process

During the production process, I encountered several practical constraints.

First, I had very limited access to existing video assets related to the product. To overcome this, I used AI image generation tools to create visual materials that could simulate the required scenes. These generated visuals were then assembled into short video clips.

Second, because the transition effect relies heavily on strong rhythm and audio impact, I used Reaper to enhance the drum beats and improve the overall sound dynamics.

Finally, I edited the generated footage using a lightweight video editing tool to assemble the sequence, apply the transition effect, and align the visuals with the audio rhythm.

Reflection & Challenges

Limited source materials

Since I did not have access to official marketing assets, I had to rely on AI-generated images to supplement missing visuals.

Limitations of AI-generated visuals

Some generated images contained errors, such as incorrect hand structures. To address this, I manually adjusted and mirrored the images, and refined them in Figma to ensure visual consistency.

Limited understanding of the product context

Because I am not yet deeply familiar with Sungrow's products and marketing strategy, some of the storytelling decisions were based on assumptions. I would be very interested in receiving feedback on whether this type of social media content aligns with Sungrow's actual marketing direction.
